

**Quick Guide to
Pest Solutions**

Dooryard Pests

Most dooryard pests (such as earwigs, sowbugs, etc.) are harmless and they usually appear during short periods. They are often breeding in the moist areas under shrubs or rocks and will occasionally wander inside during a warm period.

A chronic infestation of sowbugs may indicate a moisture problem that should be eliminated.

If they are a continued problem periodic residual spray treatments around the exterior perimeter can be effective.
